

UNIVERSITI MALAYSIA TERENGGANU

**CSM3023 WEB BASED APPLICATION DEVELOPMENT
BACHELOR OF COMPUTER SCIENCE (MOBILE COMPUTING)
WITH HONORS**

LAB 01 - SERVLET

SEMESTER I 2023/2024

Prepared for:

DR MOHAMAD NOR BIN HASSAN

Prepared by:

NUR ATIRAH BINTI SHAMSUDDIN (S67397)

Task 5: Writing a Simple Java Servlet.

Objective: Writing a Simple Java Servlet

Problem Description: To write a simple Java Servlet

Coding:

```
package com.mycompany.myfirstservlet;

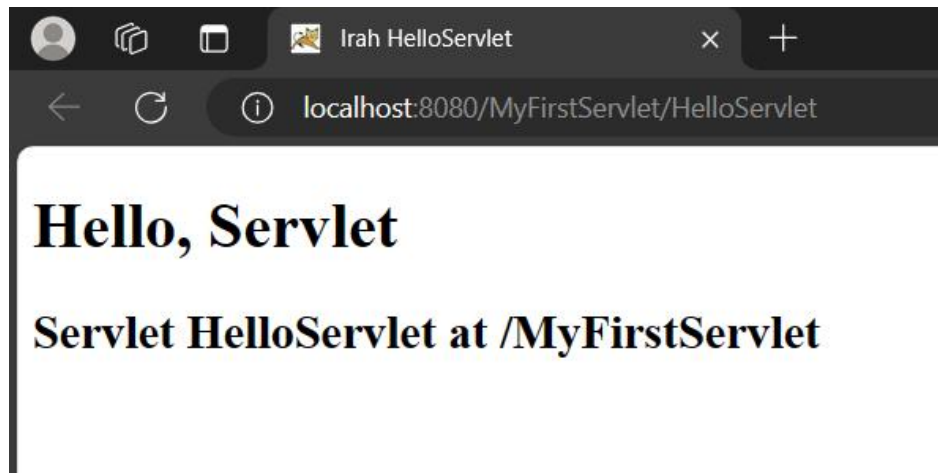

import java.io.IOException;
import java.io.PrintWriter;
import jakarta.servlet.ServletException;
import jakarta.servlet.http.HttpServlet;
import jakarta.servlet.http.HttpServletRequest;
import jakarta.servlet.http.HttpServletResponse;
import jakarta.annotation.*;

/**
 *
 * NUR ATIRAH BINTI SHAMSUDDIN, S67397
 */
public class HelloServlet extends HttpServlet {

    /**
     * Processes requests for both HTTP GET and POST
     * methods.
     *
     * @param request servlet request
     * @param response servlet response
     * @throws ServletException if a servlet-specific error occurs
     * @throws IOException if an I/O error occurs
     */
    protected void processRequest(HttpServletRequest request, HttpServletResponse response)
        throws ServletException, IOException {
        response.setContentType("text/html;charset=UTF-8");
        try (PrintWriter out = response.getWriter()) {
            /* TODO output your page here. You may use following sample code. */
            out.println("<!DOCTYPE html>");
            out.println("<html>");
            out.println("<head>");
            out.println("<title>Irah HelloServlet</title>");
            out.println("</head>");
            out.println("<body>");
            out.println("<h1>Hello, Servlet</h1>");
            out.println("<h2>Servlet HelloServlet at " + request.getContextPath() + "</h2>");
            out.println("</body>");
            out.println("</html>");
        }
    }
}
```

HttpServlet methods. Click on the + sign on the left to edit the code.

Output:

Task 6: Writing a Simple JSP Program

Objective : Writing a simple plain JSP program

Problem Description : Write a simple plain JSP program to display

“Welcome to [MATRICNUMBER]..!”

Coding:

```
Start Page X Welcome.jsp X HelloServlet.java X
Source History
1 <!--
2     Document    : Welcome
3     Created on  : 28 Mar 2024, 00:49:40
4     Author     : Nur Atirah Binti Shamsuddin
5 -->
6
7 <%@page contentType="text/html" pageEncoding="UTF-8"%>
8 <!DOCTYPE html>
9 <html>
10 <head>
11     <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
12     <title>S67397 - Web Programming 2</title>
13 </head>
14 <body>
15     <h1>Welcome to S67397 page!</h1>
16 </body>
17 </html>
18
```

Output:

Reflection

1. What have you learned from this exercise?
 - I've learned how to create a simple JSP program. JSP seems to be same as HTML to me.
2. Explain the general concept of how the JSP's file work?
 - JSP (JavaServer Pages) files are web pages that contain both HTML and Java code. When a user requests a JSP page, the web server executes the Java code and generates HTML dynamically, which is then sent to the user's web browser. This allows for dynamic content generation and interaction with databases or other backend systems within web applications.
3. Based on your observation of the previous tasks (Task 3 and Task 4), what are the differences you can find between servlet and JSP?

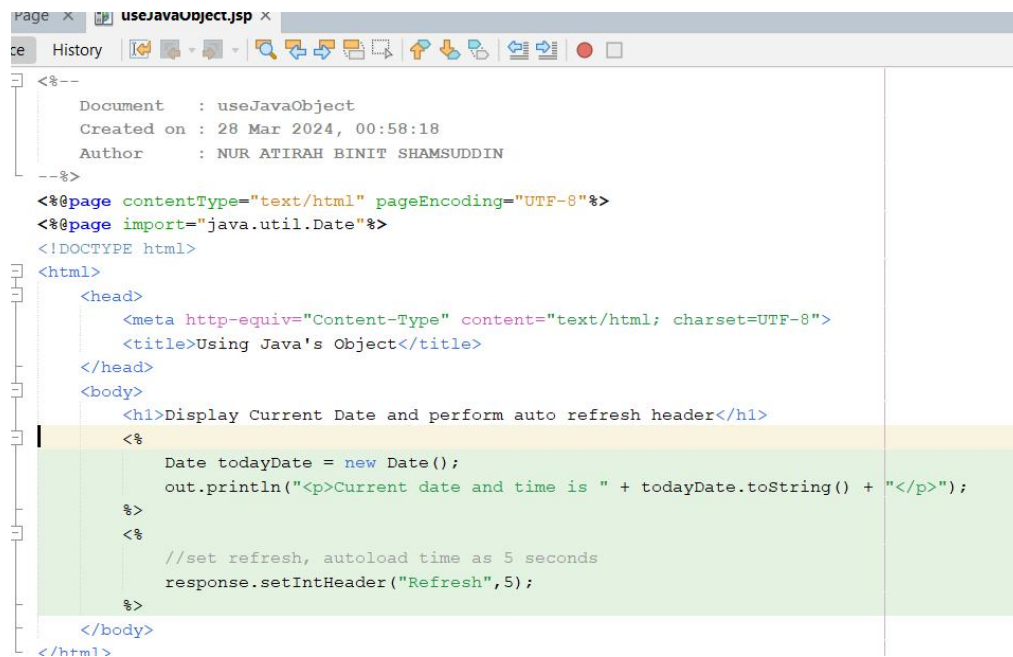

Aspect	Servlets	JSP (JavaServer Pages)
Purpose	Handle requests and responses on server side.	Generate dynamic content for web pages.
Syntax	Requires writing Java code to handle requests and responses.	Allows embedding Java code directly into HTML pages using special tags.

Task 7: Use Java Reference Datatype/Class Wrapper in JSP

Objective : Using Java's object in JSP page.

Problem Description: Display the current date, perform auto refresh header in JSP's page.

Coding:

```
<!--
Document    : useJavaObject
Created on  : 28 Mar 2024, 00:58:18
Author      : NUR ATIRAH BINIT SHAMSUDDIN
-->
<%@page contentType="text/html" pageEncoding="UTF-8"%>
<%@page import="java.util.Date"%>
<!DOCTYPE html>
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
<title>Using Java's Object</title>
</head>
<body>
<h1>Display Current Date and perform auto refresh header</h1>
<%
    Date todayDate = new Date();
    out.println("<p>Current date and time is " + todayDate.toString() + "</p>");
%>
<%
    //set refresh, autload time as 5 seconds
    response.setIntHeader("Refresh",5);
%>
</body>
</html>
```

Output:

Reflection

1. What have you learnt from this exercise?
 - JSP program can use Java's Object in its coding.
2. What is Java Scriptlet?
 - A Java Scriptlet is a block of Java code embedded within a JSP (JavaServer Pages) page. It is enclosed within `<% %>` tags and allows developers to include dynamic content and perform

server-side processing directly within the HTML structure of the JSP page. Scriptlets enable the integration of Java logic into web pages to generate dynamic content based on user inputs, database queries, or other business logic requirements.

3. How to use Java code in your JSP's page?

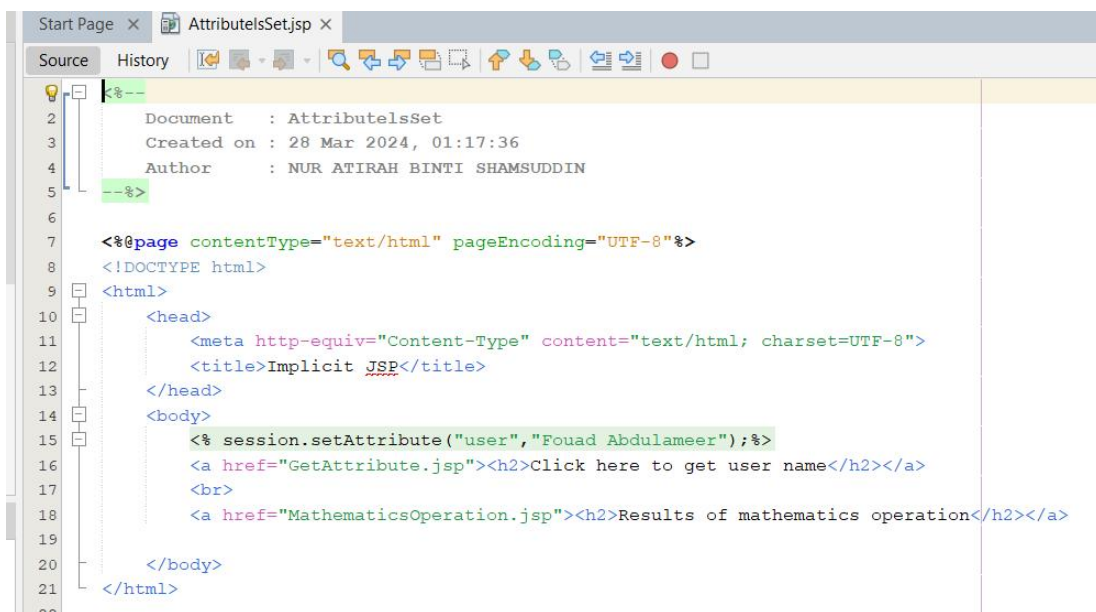

- Use a method called toString() on the Date object todayDate.

Task 8: Using JSP Implicit object in JSP page

Objective : Using JSP Implicit object (Session) in JSP page.

Problem Description: Using Session object, perform simple Mathematics operations in JSP's page.

Coding:

```
Start Page x AttributelsSet.jsp x
Source History
1 <%--
2     Document    : AttributelsSet
3     Created on  : 28 Mar 2024, 01:17:36

25 //perform basic arithmetics operation
26 addition_output = num1 + num2;
27 multiply_output = num1 * num2;
28
29 //find square root for the varioable num1..
30 squareroot = (double) (Math.sqrt(num1));
31
32 out.print("<p>Addition num1 and num2 is "+addition_output+"</p>");
33 out.print("<p>Multiplication num1 and num2 is "+multiply_output+"</p>");
34
35 out.print("<p></p>");
36 out.print("<p>Square root of "+num1+" is "+myFormat.format("%.2f",squareroot)+"</p>");
37 %>
38 </body>
39 </html>
40
```

Output:

Reflection

1. How do you want to submit specific information from one form to next form?

- By using session Attribute.

2. What happened if the field name you specify in `request.getParameter("field_name")` in the second page is different from the field name you defined in the first page?

- Won't be able to retrieve the parameter value using that field name.

Task 9: Populate Array values into HTML's Table

Objective : Read Java array and populate it into HTML's table.

Problem Description : i. Create a 2D array that store sales data.
ii. Then, read an array and populate into HTML's table.

Coding:

```
<!--
Document : populatedArray
Created on : 28 Mar 2024, 01:45:14
Author : NUR ATIRAH BINTI SHAMSUDDIN
-->

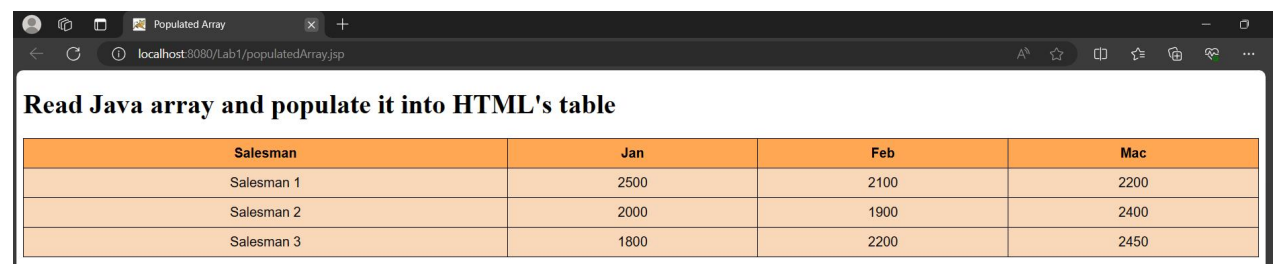

<%@page contentType="text/html" pageEncoding="UTF-8"%>
<!DOCTYPE html>
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
<title>Populated Array</title>
<style>
#salesmans{
font-family:Arial, Helvetica, sans-serif ;
border-collapse: collapse;
width: 100%;
}
#salesmans td, #salesmans th{
border: 1px solid black;
padding: 8px;
}
#salesmans tr:nth-child(even){
background-color: #f2f2f2;
}
#salesmans tr{
padding-top: 12px;
padding-bottom: 12px;
text-align: center;
}
#salesmans th{
background-color: #FFA753;
}
#salesmans td{
background-color: #F8D8B9;
}
</style>
```

```

38 </head>
39 <body>
40 <h1>Read Java array and populate it into HTML's table</h1>
41 <table id="salesmans">
42 <tr>
43 <th>Salesman</th>
44 <th>Jan</th>
45 <th>Feb</th>
46 <th>Mac</th>
47 </tr>
48 <tr>
49 <td>Salesman 1</td>
50 <td>2500</td>
51 <td>2100</td>
52 <td>2200</td>
53 </tr>
54 <tr>
55 <td>Salesman 2</td>
56 <td>2000</td>
57 <td>1900</td>
58 <td>2400</td>
59 </tr>
60 <tr>
61 <td>Salesman 3</td>
62 <td>1800</td>
63 <td>2200</td>
64 <td>2450</td>
65 </tr>
66 </table>
67 </body>
68 </html>
69

```

Output:

Salesman	Jan	Feb	Mac
Salesman 1	2500	2100	2200
Salesman 2	2000	1900	2400
Salesman 3	1800	2200	2450

Reflection

- Write a sample syntax to declare 2D Java array.
 - `dataType[][] arrayName = new dataType[rows][columns];`
- Define a sequence of steps on how you accomplish Task 7.
 - By using table tag. `<th></th>` are to define the header of the table. `<tr></tr>` are to differentiate the row of the table. `<td></td>` are to input the record by row into the table.
- What is the difference between HTML's page and JSP's page?
 - HTML pages have fixed content that doesn't change unless manually updated, like a brochure. JSP pages mix regular HTML with smart Java code to create pages that can change their content dynamically, like a personalized greeting that changes based on who's visiting the site.

- HTML pages are processed directly by web browser. JSP pages are processed by a special server called a Java web server before being sent to browser. This allows JSP pages to do more complex things like connect to databases or perform calculations before showing user the page.

Exercise:

Exercise

1. The following program is developed using Java Standard Edition.

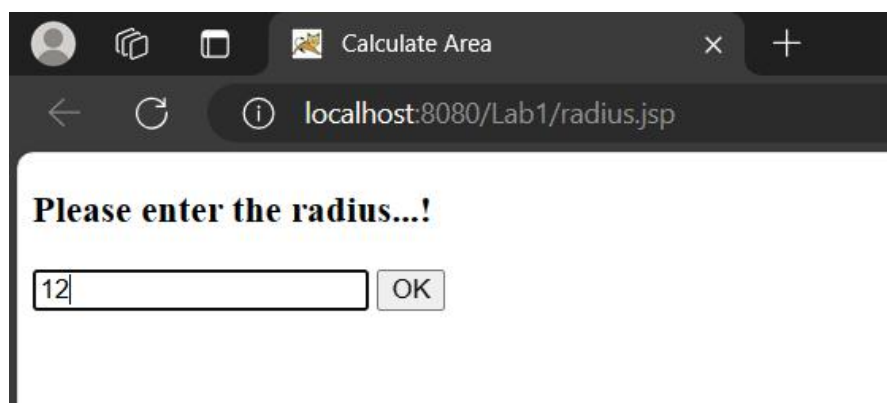

Convert this program into Web-Based application where the user can dynamically key-in radius and submit the request to get the area of a circle. You must ensure to accept only number as a radius.

Answer:

```
radius.jsp x
Source History
<!--
2      Document    : radius
3      Created on   : 30 Mar 2024, 14:26:04
4      Author      : User
5  -->

6
7  <%@page contentType="text/html" pageEncoding="UTF-8"%>
8  <!DOCTYPE html>
9  <html>
10     <head>
11         <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
12         <title>Calculate Area</title>
13     </head>
14     <body>
15         <h3>Please enter the radius...!</h3>
16         <input id="radius">
17         <button type="button" onclick="myFunction()">
18             OK
19         </button>
20         <p id="demo"></p>
21         <script>
22             function myFunction() {
23                 var x, text;
24
25                 // get the value of the input field with id="radius"
26                 x = document.getElementById("radius").value;
```

```
28                 // if x is not a number
29                 if (isNaN(x)) {
30                     text = "Input not valid";
31                 } else {
32                     // calculate the area and round it to 2 decimal places
33                     var area = 3.14 * x * x;
34                     area = area.toFixed(2); // round to 2 decimal places
35                     text = "The area of circle = " + area;
36                 }
37                 document.getElementById("demo").innerHTML = text;
38             }
39         </script>
40     </body>
41 </html>
```

Please enter the radius...!

The area of circle = 452.2

2. Prepare the following file in the Notepad and save it as *Sales.csv*.

```
10001;Credit;5000.00
10002;Cash;2500.00
10003;Credit;3000.00
10004;Cash;3200.00
10005;Credit;1200.00
10006;Cash;6000.00
10007;Credit;7400.00
10008;Cash;800.00
```

Create a simple JSP's page to read Sales.csv file. Upon reading Sales.csv's file, calculate the discount and populate HTML's table in the JSP's page.

Customer	Cust. Type	Purchase	Discount
10001	Credit	5000	0.00
10002	Cash	2500	250.00
10003	Credit	3000	0.00
10004	Cash	3200	320.00
10005	Credit	1200	0.00
10006	Cash	6000	600.00
10007	Credit	7400	0.00
10008	Cash	800	80.00

Cash customers are eligible to get a 10% discount.

Answer:

```
Source Sales.jsp x
38
39 // Ensure data array has 3 elements
40 if (data.length == 3) {
41     String customer = data[0];
42     String custType = data[1];
43     double purchase = Double.parseDouble(data[2]);
44     double discount = 0.0;
45
46     // Calculate discount for cash customers
47     if (custType.trim().equalsIgnoreCase("Cash")) {
48         discount = purchase * 0.1; // 10% discount for cash customers
49     }
50
51     // Display the data in the table
52     out.println("<tr>");
53     out.println("<td>" + customer + "</td>");
54     out.println("<td>" + custType + "</td>");
55     out.println("<td>" + purchase + "</td>");
56     out.println("<td>" + discount + "</td>");
57     out.println("</tr>");
58 } else {
59     // Handle case where data is not in the expected format
60     out.println("<tr><td colspan='4'>Invalid data format: " + line + "</td></tr>");
61 }
62 }
63 br.close();
64 } catch (IOException e) {
65     out.println("<tr><td colspan='4'>Error reading file: " + e.getMessage() + "</td></tr>");
66 }
67 }
68 }
